

ON6MU

VHF Optimized Yagi Antenna for the 6-meterband (50 Mhz)

RE-A50Y3

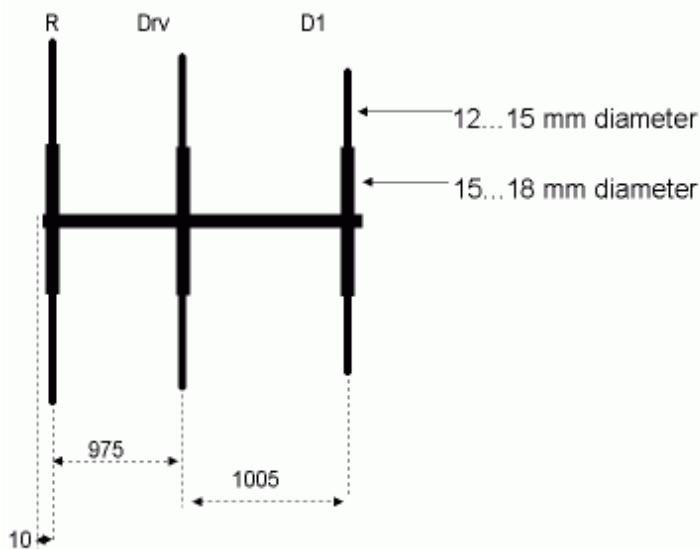

By Guy, de ON6MU

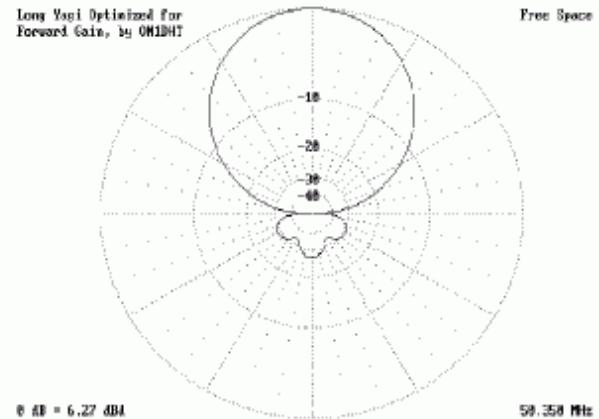

Schematic fig1

3 ELEMENT 50MHZ LONG YAGI de ON6MU

Top view

Antenna radiation pattern

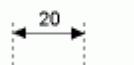

Element	Length	Prog. Spacing
Reflector	2940	10
Driver	2870	985
Director 1	2660	1990

Boomlength = 2000 mm., thickness +- 20 mm.
Aluminum tube diameters 12mm and 15mm.
Used material: 3 alu tubes of 2 meter (15mm),
3 alu tubes of 2 meter (12mm)

Specifications

Forward gain	= 6.1 dBd
Front-to-Rear ratio	= 25 dB
SWR on 50.300 MHz	= 1
SWR on 50.0 & 50.6 MHz	= 1.2
Hor. plane pattern	= 45°
Ver. plane pattern	= 55°
Bandwidth	= 2 MHz

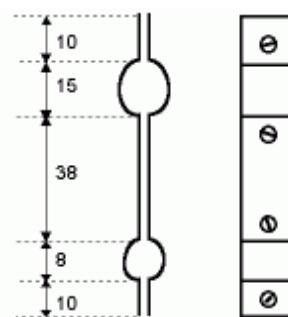

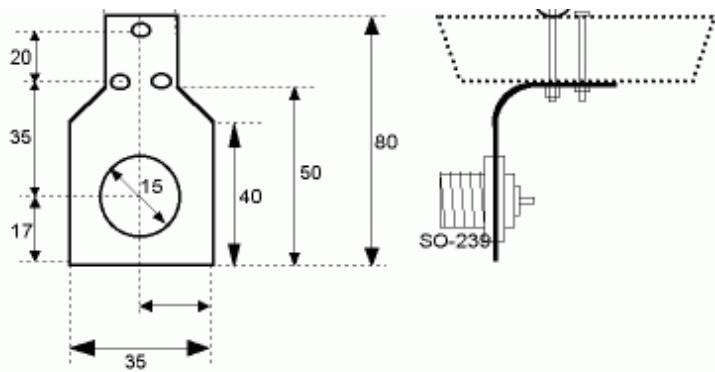

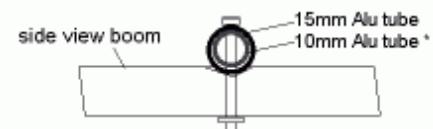

Bracket for SO-239 plug on boom

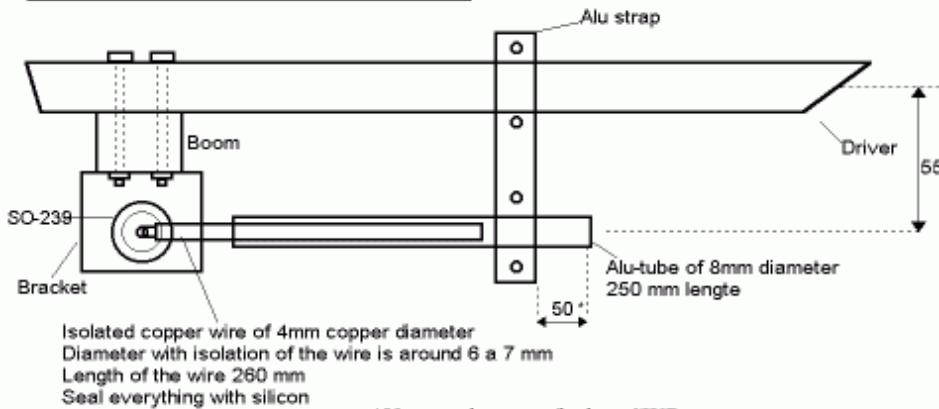

Boom

Aluminum Strap

Example element connection to boom

Tip: Slide a bit smaller alu tube in to each element on the place where you connect the element to the boom. This to prevent from crunching the elements when screwing them firmly to the boom.

Parts list for the long yagi antenna RE-A50Y3

- 2 meter long alu/copper pipe/tube of +/- 20...28mm (square or round)
or if using portable, use 2 x 1 meter pipes/tubes fitted together in the middle of the boom with a larger piece that slides over. Same goes for the centre of the elements.
- 6 pieces of 1 meter alu or copper tubing:
- 12...16 mm diameter

- 3 pieces of 2 meter long alu or copper tubing:
- 15...20 mm diameter
- Gamma match: alu or copper tube of 250 mm of 8mm diameter
- some cul wire (isolated wire, installation wire, etc.) of 4 mm copper diameter (+/- 6...7mm diameter with isolation)
- some alu/copper plates to construct the strap holder for the gamma-match
- 1 female PL 259 chassis
- some silicon, grease... to make the construction weather resistant.
- several lengths of innox bolts or other non oxidating bolts
- a bracket to mount the yagi to a boom
- and a few innox hose clamps

Note: there are many ways to build your antenna and I'm sure some can come up with better mechanical designs then described here although the design and material used here is cheap and easy to find. Also, the diameters of the tubing described here is not too critical.

Gamma-match

When the dipole is the driven element of a Yagi parasitic array, the impedance that appears at the center of the driven element will usually be quite different from that of the isolated dipole. The reason for this is that the Yagi antenna is equivalent to a number of resonant circuits tuned to different frequencies and coupled together. The self-impedance of the parasitic elements and mutual impedance between parasitic elements and driven element cause resistance and reactance to be coupled into the driven element. A gamma-match tube acts like a capacitor. The "capacitor's" sole purpose, is to oppose unwanted inductive reactance. It is a series-tuned LC circuit between the coaxial cable's center conductor and the gamma's connection point at the driven element hence getting a pure Ohms resistance. So, a gamma match taps a point on one side of the center of the driven element and connects the feedline to that point through a capacitor. In this design a tube with a copper wire inside acts as air-spaced capacitor. Another advantage is to allow the center of the driven element to be directly grounded to the antenna's boom, making driven element assembly easier and no static build-up on the driver.

To tune the gamma-match to a desired frequency for best SWR you will need to experiment with the placement of the strap on the driver (feedpoint) and the position of the strap relative to the feedpoint.

If you build the yagi antenna according to above specs, then you should be pretty close (if not spot-on) to a ideal match.

How Hernan, LW5DTZ did the Gamma-match

Specifications ON6MU 50 Mc wide-spaced yagi antenna RE-A50Y10

- Total length 2 meters
- Max width 2,95 meter
- Peak centre frequency: 50,5 Mhz
- Maximum bandwidth: 2...2,5 Mhz
- Gain: 6,1 dBd
- F/B ration: 25dB
- Horizontal opening angle: 45°
- Vertical opening angle: 55°
- Maximum tunable frequency range: 49...54 MHz+-
- impedance: 50 Ohms
- Maximum power using the components described: 300 watt
- DC grounded (no static buildup due to all elements being electrical/mechanical connected at the center. Of course the boom/tower/mast itself needs to be grounded too)
- Solid air-spaced gamma-match design
- If needed, it can be disassembled into a very small bundle no longer than the longest element being 1 meter.

Be sure to seal everything up to avoid moisture, corrosion etc...
